

# The state of Cloud Security programs in 2021

As workflows transition to the cloud, security professionals must now contend with an entirely new attack surface. How are they doing?

## But as cloud adoption accelerates, security programs don't match the pace...

## Conclusion

While organizations are rightly tapping into the potential of cloud data storage, the resulting rising vulnerabilities fast outpace security programs' processing and prioritization efforts. But security concerns should not prevent migration to the cloud. Organizations need to secure their cloud in a dedicated cloud security program, and implementing a dedicated single-source-of-truth risk mitigation solution for multi-cloud security can help this process become more efficient and ultimately more secure.
